

Innovating the rehabilitation care system

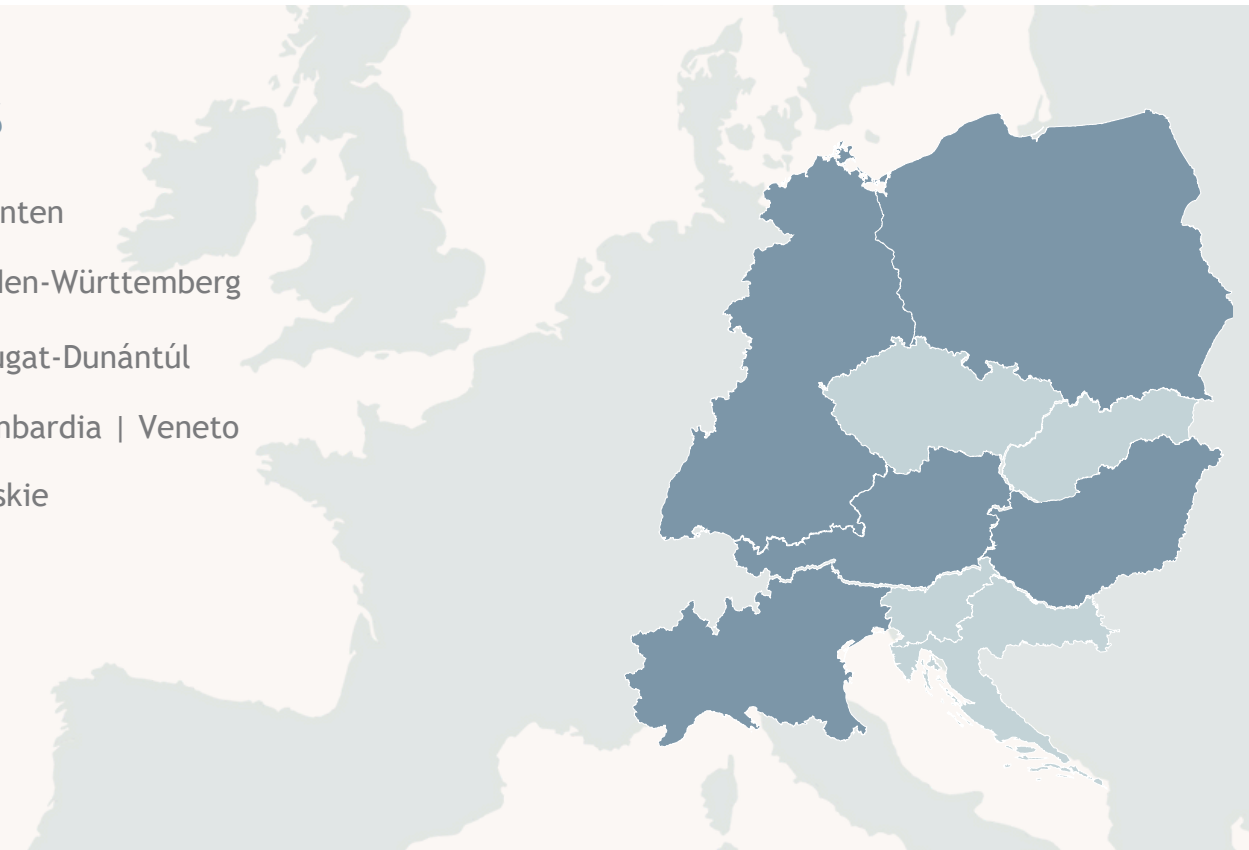

Rehabilitation is care that helps people get back or improve abilities necessary for their daily life. The challenge is that such a care often lies with the family without much systemic or technological support. The RehAlliance project helps MedTech companies to break-through and accelerate the commercialisation of their products. The project partners share experiences and good practices to develop a set of policy recommendations to improve the health care sector's innovation governance. They will test new technologies, such as rehabilitation robots or exoskeletons, assistive devices, wearables or telemetric tools.
